OmagoAI – Orchestrated Multi-Agent Guardian for Open-trading

1. Problem Statement

1.1 Current Challenges in Financial Accessibility for cognitive and learning disabled people

Cognitive Overload

- **Complex Interfaces:** Graph-heavy dashboards and flashing tickers create sensory overwhelm.
- **Jargon Barriers:** Terms like "P/E Ratio," "MACD," and "Margin Call" require high financial literacy.
- **Risk of Loss:** Misinterpretation of data leads to impulsive, high-risk financial behavior.

Accessibility Gaps

- **One-Size-Fits-All:** Existing platforms do not adapt to reading levels or cognitive processing speeds.
- **Lack of Safety Rails:** No built-in mechanisms to "slow down" a user before a risky trade.

1.2 Platform Requirements

Functional Needs

- **Jargon Translation:** Instantly convert financial terms into grade-school level explanations.
- **Risk Orchestration:** Hybrid scoring (ML + LLM) to objectively assess trade safety.
- **Simplified Visualization:** Break down complex charts into narrative summaries.
- **Actionable Synthesis:** Convert analysis into simple "Checklist" steps.

Non-Functional Needs

- **Low Latency:** Real-time routing between user intent and agent execution.
- **Safety-First:** Architecture must prioritize risk warnings over trade execution.

- **Context-Aware:** Agents must share a unified understanding of market conditions

2. Solution Architecture

2.1 Multi-Agent Orchestration Pipeline

OmagoAI utilizes a **Hub-and-Spoke** agent architecture. A central orchestrator manages state and routes intent to specialist agents, ensuring that no single model is overwhelmed by the complexity of the domain.

2.2 Data Analysis on Yahoo Finance Market Data

To support reliable and consistent risk estimation, extensive data analysis is performed on historical stock market data sourced from Yahoo Finance. This analysis forms the backbone of the machine-learning-based risk assessment and ensures that the system reflects real-world market behavior patterns.

Key data analysis steps include:

- Collection of long-term historical price data (Open, High, Low, Close, Volume) for selected Indian stocks
- Cleaning and normalization of time-series data to handle missing values and anomalies
- Feature engineering to derive volatility measures, returns, and trend indicators
- Integration of fundamental indicators such as market capitalization, P/E ratio, and earnings data
- Alignment of historical price behavior with known market events for better contextual learning
- Preparation of structured datasets used to train and validate the XGBoost risk model

2.3. Agent Specialization

Agent Role	Responsibility	Input/Output

Lead Router (Orchestrator)	Classifies user intent (Trade, Explain, General) and maintains Session State.	Input: User Query Output: Routing Path
Risk Agent	Calculates safety score using a hybrid approach: Classical ML (XGBoost) + Fundamental Analysis (Gemini).	Input: Ticker, Market Data Output: Risk Score (Low/Med/High)
Jargon Agent	Detects financial terms and generates analogies/flashcards.	Input: Complex Term Output: Simple Text + Audio + flashcard
Chart Agent	Analyzes price movement trends (volatility, highs/lows) to explain visuals.	Input: Market Ticks Output: Narrative Summary

News Agent	It takes real-time financial news and converts it into short, simple, explainable insights with a clear impact level so cognitive and non technical users can understand what's happening and why it matters.	Input : Real-time company/market news headlines and snippets Output: A simple, grounded summary with event type and a low/medium/high impact score for risk awareness (no advice)
-------------------	---	--

2.4. Assistant Tab

2.4.1 Lead Router/Orchestrator Agent

The agent acts as the central interface for all user interactions, including learning queries, market exploration, and simulated trading actions.

Single-Agent Limitations

- Limited context window for handling large research tasks.
- Sequential execution with no parallel data collection.
- Lack of role specialization—one agent must handle all stages of research.
- No systematic verification of citations and claims.

Existing Tools Fall Short

- Search engines only return results, not structured insights.
- Academic databases require domain-level expertise to query effectively.
- Current AI assistants lack systematic workflows and fact-checking.

Orchestrator Agent analyzes the user's intent and dynamically routes the request to one or more specialized agents, such as:

- **Risk Agent** for trade risk evaluation
- **Jargon Agent** for explaining financial terms

This routing mechanism ensures a clear separation of concerns and allows the system to distinguish between *learning-oriented queries* and *action-oriented trading interactions*.

2.4.2 Risk Agent (Core Intelligence)

The Risk Agent is responsible for estimating the risk associated with a simulated trade using a **hybrid AI approach**.

Inputs Considered

The agent evaluates multiple factors, including:

- Selected company
- Number of shares
- Current simulated market price
- Fundamental indicators
- Broader market context

Dual-Model Risk Evaluation

LLM-Based Reasoning

A large language model is prompted to behave like a statistical risk estimator. It reasons over market context and inputs to generate qualitative explanations that are easy for humans to understand.

XGBoost Model

A supervised machine learning model trained on historical Yahoo Finance data of major Indian stocks, including: RELIANCE.NS, TCS.NS, INFY.NS, HDFCBANK.NS, ICICIBANK.NS, HINDUNILVR.NS, ITC.NS, SBIN.NS, BHARTIARTL.NS, ASIANPAINT.NS, TITAN.NS, WIPRO.NS, MARUTI.NS, ULTRACEMCO.NS, and SUNPHARMA.NS

Output

- Final risk category: Low, Medium, or High
- Clear, human-readable explanation for the risk classification
- No buy or sell recommendation, focusing strictly on risk awareness

2.4.3 Jargon & Glossary Agent (Inclusive Learning)

When users ask conceptual questions such as “**What does RSI mean?**” or interact with the platform’s **Glossary section**, the system invokes the **Jargon Agent**, a specialized agent dedicated to making financial terminology approachable and inclusive.

The Jargon Agent explains complex financial concepts using **simple, everyday language** and **real-world analogies**, avoiding technical jargon and mathematical formalism. Rather than presenting textbook-style definitions, explanations are delivered in a **storytelling format**, allowing users to intuitively understand how a concept works and why it matters in practical scenarios.

Within the **Glossary section**, users can search for any financial or trading-related term. Upon selection, the Jargon Agent generates a **dedicated explanation card** that combines:

- A simplified textual explanation
- A story-based narrative for intuitive understanding
- Audio narration for enhanced accessibility

This unified approach ensures that **cognitively disabled individuals, newcomers, non-technical users** can explore and learn financial concepts **without intimidation or cognitive overload**.

2.5 Market Simulation Module

2.5.1 Company Overview

The Market Simulation module currently displays six companies, with the design allowing easy future extension:

- Tata Consultancy Services
- Infosys
- Reliance Industries
- HDFC Bank
- ICICI Bank
- ITC Limited

Each company card presents:

- Sector information
- Current simulated price

- Directional price movement (up or down)
- Quick access to detailed views

2.5.2 Price Chart Interaction

When a user selects a company in the **Market Simulation** module, price movement is shown using a **simple line chart instead** of candlestick charts to prioritize accessibility and reduce cognitive load. Users can view short-term trends across **1, 2, 4, and 10-minute intervals** using a consistent, easy-to-read visualization. An **“Explain Chart”** option invokes an explanation agent that narrates the trend and notable changes in plain language, avoiding jargon or trading advice while maintaining a calm, user-first tone.

- The **overall trend direction** (such as upward, downward, or stable movement)
- **Volatility behavior**, indicating whether prices are changing smoothly or fluctuating frequently
- **Sudden price movements**, highlighting notable spikes or drops in a simple, contextual manner
- **Deterministic** in nature

All chart explanations are delivered in **plain, non-technical language**, avoiding financial jargon and complex statistical terms. This ensures that users not only see the data but also understand what it signifies, reinforcing the platform’s goal of making market behavior interpretable, inclusive, and educational.

2.5.3. Buy / Sell Flow with Risk Awareness

When a user initiates a simulated buy or sell action in the Market Simulation module, the platform applies a risk-first evaluation before allowing the action to proceed. After selecting the action type and quantity, the system computes the estimated transaction value using the current simulated price, and the Risk Agent is automatically invoked to assess downside exposure.

The Risk Agent evaluates multiple dimensions of risk, including:

- **Fundamental indicators:** valuation metrics, earnings strength, leverage, and volatility
- **Position exposure:** share quantity and overall size of the simulated trade
- **Market context:** recent price behavior and simulated volatility conditions
- **News and events:** recent company or market developments reflected through a news impact score

To ensure robustness and explainability, the Risk Agent uses a **hybrid intelligence approach**:

- A **Large Language Model (LLM)** applies structured reasoning through prompt engineering, behaving as a statistical estimator to interpret fundamentals and contextual signals in human-readable terms. Here we have used the Gemini model (**Gemini 2.5 Flash Lite**) because it is **cost-effective, fast, and supports a large context window, thereby reducing latency and managing large volume**.
- An **XGBoost model**, trained on historical Yahoo Finance data of major Indian stocks, provides a data-driven risk estimate based on technical and market-derived features.
- A **news impact score**, derived from recent company-specific news, is incorporated to account for short-term uncertainty caused by events such as earnings announcements or major business updates.

The outputs of these components are combined to produce a **final risk score**, which is categorized into **low, medium, or high risk**. Alongside the numerical score, the system generates a **calm, non-alarming explanation** that clearly communicates *why* the risk falls into a particular category.

2.5.4. News & Events (Hybrid RAG + NewsAPI)

The **News & Events** module converts raw financial news into **clear, explainable insights** tailored for non-technical users by combining real-time news retrieval with **Retrieval-Augmented Generation (RAG)**. Instead of exposing users to dense articles, the system filters, contextualizes, and explains what matters—focusing on awareness and risk understanding rather than predictions or advice.

How it works

- **NewsAPI (real-time input)**: Fetches company-specific news first; falls back to broader market news when needed to avoid gaps.
- **RAG-powered intelligence**: Retrieves only relevant snippets, grounds explanations in verified sources, and produces short, factual, human-readable summaries.
- **Explainable interpretation**: Translates events into *what happened, why it matters, and potential risk relevance*—without financial advice.
- **Structured outputs**: Each item includes a **headline, event type** (earnings, regulation, macro, etc.), and an **impact score (Low/Medium/High)** indicating informational significance.

2.5.5. Fundamentals & Financials (Explainable Cards)

- **Explainable metric cards:** Fundamental and financial metrics such as **P/E ratio, EPS, Beta, Market Capitalization**, and other valuation or risk indicators are presented as clearly labeled, interactive cards to reduce visual and cognitive complexity.
- **Jargon Agent integration:** Clicking any card invokes the **Jargon Agent**, which translates complex financial terms into **plain language explanations and relatable analogies**, avoiding technical definitions.
- **Accessibility-first explanations:** The explanations are designed for beginners, non-technical users, and cognitively disabled individuals, ensuring concepts are intuitive rather than intimidating.
- **Optional audio storytelling:** Each metric includes **audio narration generated by the Jargon Agent**, allowing users to learn through listening as an alternative to reading.
- **Consistent across indicators:** The same explainable-card pattern is applied to **volatility and risk metrics**, ensuring uniform understanding across different data types.
- **Reduced cognitive load:** By combining visual cards, simple explanations, and audio support, the platform turns complex financial data into a **clear, inclusive, and user-friendly learning experience**.

3. Architecture

Basic UI Flow:

Flow Diagram for Buy/Sell in Market Simulator:

Flow Diagram for Chart Agent

Flow of Jargon agent and news agent

4. Technology Stack

Layer	Component	Description & Usage
Frontend & UI	Streamlit	Rapid development framework for the interactive web-based dashboard and session management.
	Interactive Line Charts using Plotly	Simplified visualization replacing candlestick charts to reduce cognitive load; tightly coupled with narrative explanations.
	Custom HTML & CSS	Renders "Explainable Flashcards" with interactive elements for learning financial fundamentals.
Backend & Core	Python	Primary programming language for orchestration, data processing, and agent logic.
	Modular Agent Framework	Hub-and-spoke architecture isolating responsibilities (Risk, News, Jargon, Chart) for system stability.
	Pandas	High-performance data manipulation for simulated market ticks, event streams, and time-series aggregation.

	Regex & JSON	Ensures safe input sanitization and strict structured communication between agents and the UI.
AI & ML Engine	Large Language Models (LLMs) (Gemini ~ Gemini 2.5 Flash Lite)	Handles reasoning, narrative generation, and intent classification with strict prompt engineering to prevent hallucinations.
	XGBoost	Gradient boosting model trained on historical stock data to provide statistically grounded risk scores.
	Hybrid RAG	Combines live API fetches with static document retrieval to ensure context-aware news analysis and resilience.
Data Sources	Yahoo Finance	Source for historical price data, technical indicators, and model training inputs.
	NewsAPI	Provides real-time business headlines for sentiment analysis and immediate impact scoring.
Accessibility	Story-Based Narration	Transforms complex financial jargon into grade-school level analogies and stories.

	Text-to-Speech (TTS)	Generates audio explanations for users with visual impairments or reading difficulties.
	Generative Visuals	Dynamically creates image-based flashcards to reinforce concepts through visual learning.

5. Innovation Highlights

1. Orchestrator Agent – Intent Analysis & Dynamic Routing

- Acts as the **central decision layer**, analyzing each user query to infer intent (learning, clarification, or risk exploration).
- Dynamically routes requests to specialized agents such as the **Risk Agent** or **Jargon Agent** instead of using a single generic pipeline.
- Ensures queries are handled by the **most context-appropriate expertise module**.
- Prevents unnecessary computations and irrelevant agent activation
- Enables scalable and modular system behavior as new agents are added.

2. Separation of Concerns & Ethical Interaction Control

- Clearly distinguishes between **learning-oriented** and **action-oriented** interactions.
- Prevents educational queries from triggering trading or simulation logic.
- Ensures risk evaluations are not framed as recommendations or advice.
- Reduces cognitive overload by avoiding redundant or irrelevant analysis.
- Maintains **ethical boundaries and calm AI behavior** across all interactions.

3. Hybrid Risk Estimation (LLM + XGBoost + News Impact)

- Uses **XGBoost** to model historical market behavior from price, volatility, and fundamentals (Yahoo Finance).
- Employs an **LLM for contextual reasoning** over trade parameters and market conditions.
- Integrates **news impact analysis** to capture short-term volatility triggers.
- Fuses numerical evidence with qualitative context for balanced risk assessment.
- Produces an **explainable risk score** without directional trading advice.

4. Explainable AI for Non-Technical Users

- Replaces opaque scores with **plain-language explanations** for every risk output.

- Explains *why* a trade is labeled low, medium, or high risk.
- Avoids financial jargon, equations, and technical indicators.
- Builds user trust through transparency and clarity.
- Treats explainability as a **core design principle**, not an afterthought.

5. Accessibility-First Interface with Audio & Storytelling

- Presents financial insights through **storytelling-style explanations**.
- Offers **audio narration** for concepts, charts, and risk summaries.
- Supports visually impaired and cognitively disabled users.
- Provides multiple modalities: text, narrative, and audio.
- Reduces cognitive load while improving comprehension and inclusivity.

6. Simplified, Candlestick-Free Visualizations

- Replaces candlestick charts with **clean line charts** for clarity.
- Focuses on overall trend direction instead of micro-patterns.
- Uses short, clearly labeled time ranges for easier interpretation.
- Minimizes visual clutter and misinterpretation risks.
- Aligns visualization design with **risk awareness**, not speculation.

7. Ethical, Calm, and Non-Advisory AI Behavior

- Does **not** provide buy/sell recommendations or profit predictions.
- Avoids urgency-driven or persuasive language.
- Communicates risk using a neutral, reflective tone.
- Prevents overconfidence and impulsive decision-making.
- Positions the platform as an **educational awareness tool**, not a trading authority

6. Implementation Screenshots

Fig 1: Interactive UI

Ask a question or describe an action

Example: 'I want to buy ₹200 of TSLA' or 'What does RSI mean?'

I want to buy ₹2000 of TCS.NS

Send

Send (LLM)

Response

Trade check (simple):

- Goal: Buy ₹2000 of TCS.
- Risk level: medium (score 62/100).
- Read the risk reasons below.
- Why: The stock's price is high compared to its earnings. It moves with the market. It has some debt. Its price swings are moderate. This suggests a moderate chance of losing value.
- Pick one safer option:
- Option: The combined risk assessment indicates a medium risk level for this action.
- If you still want to continue, confirm the details and place the order.

Before you confirm, answer:

- Is the ticker correct?
- Is the rupee amount correct?
- Do you understand you could lose money?

localhost:8501

Example: 'I want to buy ₹200 of TSLA' or 'What does RSI mean?'

What does EMA mean?

Send

Send (LLM)

Response

EMA is a special way to track prices. It's like a moving average, but it pays more attention to recent prices. Think of it as a quicker way to see the direction the price is going. Old prices don't matter as much. It helps traders guess what might happen next with the price. It's a tool to help them make smart choices.

Glossary search

Search a term

resistance

Search

Term explanation

Imagine a ceiling for a price. When a price tries to go up, it might hit this ceiling and stop. This ceiling is called resistance. It's like a wall that makes it hard for the price to climb higher. If the price keeps bumping into the ceiling, it might fall back down. But if it pushes through the ceiling, it can go much higher. Traders watch these ceilings.

Market Cap

Value
₹6.5T

Market Cap

Imagine a company is like a big pizza. Market cap is how much that whole pizza is worth. It's the total value of all the slices put together. We find this by counting how many slices there are. Then, we look at the price of just one slice. We multiply the number of slices by the price of one slice. That big number tells us the total worth of the pizza, or the company.

0:00 / 1:22

MARKET CAP

Price per Stand x Total Stands

TOTAL SIZE

The total value of the whole company.

If your lemonade stand "Empire" has 10 stands and each one is worth \$100, your **Market Cap** is \$1,000.

₹255,324 Cr

Revenue

Revenue is the money a company makes from selling its stuff. Think of it like the total money you get from selling all your lemonade at a stand. It's the income before taking out any costs. If a company sells toys, the money from selling those toys is its revenue. It shows how much business the company is doing. More revenue usually means more sales. It's like the total score in a game.

REVENUE

Lemonade Stand

MONEY COMING IN

Total money from selling stuff.

Think about a Lemonade Stand:

Every cup you sell brings in cash. Before you pay for lemons or sugar, all that cash is your **Revenue**.

It is your TOTAL SCORE! 🏆
